

How to Import an Account into MetaMask Using a Private Key

Housework Credits — Mandala Testnet

This guide shows the steps to add one of the three Housework Credits accounts (Mom, Dad, or Kid) into MetaMask using its private key.

The three accounts

Name	Address
Mom	0x41B369433CBb723DA46b6BA99d737c41e48824A3
Dad	0xb48a48358D4E473BB510F7a45f845018F645821c
Kid	0xed2f24cFd88d5677e34FD5D593416171fE00330e

Public addresses only. Private keys for these three accounts were shared directly and securely with the recipient outside of this document, for security reasons — private keys should never be written into a shared document.

Step 1 — Open the account list

1. Open the MetaMask extension.
2. Click on the account name at the top, next to the small arrow, to open the account

Screenshot: MetaMask's account list, showing existing accounts with their addresses.

Step 2 — Start adding an account

3. At the bottom of the account list, click "Add an account".

Screenshot: the account list with the "Add an account" option visible at the bottom.

Step 3 — Choose Import Account

4. On the next screen ("Add a portfolio"), choose "Import Account — Via a private key" (not "Import a portfolio", which uses a recovery phrase, and not "Connect a hardware wallet").

Screenshot: the three import options — Import a portfolio, Import Account, Connect a hardware wallet.

Step 4 — Paste the private key

5. Select "Private key" as the type.
6. Paste the private key you were given for this account.
7. Click "Importer".

⚠ Never share a real screenshot showing the private key itself in plain text. The field should stay masked (dots), as shown below.

Screenshot: the private key import screen, with the key field safely masked.

Note: if you try to import a private key for an account that already exists in that MetaMask wallet, you will see "The account you are trying to import is a duplicate" — this is expected and confirms MetaMask correctly prevents duplicate accounts.

Step 5 — Confirm the account appears

8. Once imported successfully, the account appears in the account list with its real balance.

The same private key works across all EVM-compatible networks (Ethereum, Arbitrum, Mandala, etc.) — it does not need to be re-entered per network.

Step 6 — Repeat for the other accounts

Repeat steps 1 to 5 for each additional account (Dad, Kid), so all three accounts are available in the same MetaMask wallet.

Step 7 — Connect to the app with a chosen account

9. In MetaMask, select the account you want to use.

10. Open the Housework Credits app link:

<https://celadon-bonbon-0ef04c.netlify.app>

2026-09-04

<https://agent-6a981562943ccc4--spontaneous-muffin-d0f871.netlify.app/> 11. Click

"Connect wallet & load".

12. Check the text under the button — it should say "Connected as" followed by the start of that account's address, matching the table above.

Step 8 — Switch to a different account

13. Go back to MetaMask and select a different account.

14. Refresh the app's page.
15. Click "Connect wallet & load" again.
16. Confirm the "Connected as" text has changed to match the newly selected account.

Once all three accounts are imported, switching between them in MetaMask and refreshing the app is all that is needed to act as Mom, Dad, or Kid.

The prompt used to build this app

For reference, the following prompt summarizes the original request used to build Housework Credits with AI assistance:

"Build a simple smart contract and web app called Housework Credits on Mandala Chain Testnet. The app should have 3 fixed blockchain accounts, each starting with 3 tokens. Tokens can be sent between any of the 3 accounts, managed entirely by a smart contract, with every transfer tracked permanently on the blockchain. Include a simple web frontend, connected via MetaMask, so a non-technical user can view balances and send tokens without using any command line."
